Erledigt DSDT fix Z87MX-D3H (OZ167X)

Beitrag von „Huberer" vom 26. Februar 2016, 22:08

I have no idea why sleep isn't working proberly. You say that wol is important. So that means you have enabled wol in bios and also under OSX. What happen when you disable it? Does sleep work?

Another question. Is there a usb-port on the back you don't use? I'm asking because I will create a new dsdt, with cutted down usb entries. That means that your both front usb will work but I've to go down to 15 because of EC restriction. Therefore you don't need any kext.
