DSDT fix Z87MX-D3H (OZ167X)

Beitrag von „Huberer“ vom 27. Februar 2016, 13:35

Also. As you can see you have different options. At least one paid and one free. Don't know which one works better. You can try. I also suggest you to read this thread [here](#). I had the problem that my hackintosh (with Mavericks and with El Capitan) woke up every 2 hours (while it was sleeping). With patching the com.apple.mDNSResponder.plist the problem under Mavericks was gone. Under El Capitan I had to use this command:

Code

1. `sudo defaults write /System/Library/LaunchDaemons/com.apple.mDNSResponder.plist ProgramArguments -array-add -DisableSleepProxyClient`

but [SIP](#) must be disabled and you have to restart the computer afterwards.

So it looks like that your problems are partly solved, doesn't it?
