[Zitat von crusher](#)

```
boot via hermitshell and write  
setvar -guid 1F8E0C02-58A9-4E34-AE22-2B63745FA101 AtiFramebuffer=Hamachi
```

ERROR: Variable AtiFramebuffer=Hamachi not found!

What is wrong with my board? I can't boot with IGFX nor can I boot with my HD7850..

Update (tried with the HD7850):

Okay I can boot now (the forbidden logo is gone) but I won't get the GUI. I only have DP and HDMI, no DVI to test. Same goes for the USB installer, boots until the screen flickers and then my screen goes into standby.

It looks like it does not fully boot up because screen sharing isn't working.

Update 2 (tried with internal GFX):

System boots forever... The screen won't go into standby but GUI never shows up.

Update 3:

Booting in verbose mode gives me:

"busy timeout[0], (60s), kexts wait(0): 'IGPU'"

"busy timeout[1], (60s), kexts wait(0): 'IGPU'"
