Z97X-UD3H & GTX 760

Beitrag von „Fredde2209“ vom 2. November 2016, 14:28

Why do you want to use iMac 14.2 instead of 14.1? The only difference is the Display size (Oh... I see al already wrote this 😜). I think it doesn't really influence the PCs behaviour in any way, so you can leave it as it is. And the iMac15.1 didn't have a GTX graphics card, why these only work with extra patches. This isn't worth the effort bro
