> Many desktop computers work very well with external mic back and front. We're just trying to find a better solution for McRudolfo.

the effect is still there,but I'm not going to argue with you (I wanted to say that we should not forget about other components in General), I noticed that the this codec on different motherboards behave differently and one solution for all does not fit

Many desktop computers work very well with external mic back and front (Yes,but not in this codec)

the main problem because of what can not work both microphones ,no values Vref caps: HIZ 50 GRD 80 100 in the codec dump on the node of the microphone,it is impossible to prescribe the parameter MuteGPIO.

Can enable one-time at startup OS (1 of 2) add the node to the desired microphone additional verbs (number codec ,number node,70721)
