Erledigt # X99 - 6850K - El Capitan / Sierra | Absturz bei hoher Last (SOLVED!)

Beitrag von „sirbrem" vom 27. April 2017, 23:07

Thanks!

I actually got it working last night!

My method was to use the latest version of Clover to perform the install of Clover EFI. Once it was installed, I copied any missing drivers from @sygey 's install. I then downloaded the latest FaceSMC, VoodooTSCSync (6 core) and ethernet kexts, and any missing ones I grabbed from sygey. I also had to use a combination of the two config.plist files from here.

There were a few hiccups along the way and there are still some bugs to work out, but for the most part macOS Sierra 10.12.4 is up and running.

I can post a more detailed install process if anyone is interested in this hardware setup.
