Hi! onsepakise!

I think you must remove all dsdt and ssdt files from acpi patched folder from clover .

And try not use all kext just try with essential kext fake smc and vodootscsync try to test with one by one kext

maybe you can try just with the dsdt file inside acpi patched folder

you have to play with some settings in clover config file ... special in Acpi section and Kernel & kext patches .

And a very important think its...that my fake cpu ID 0x0306F2 its not god for your processor type you have to find a fake cpu id for your model and change it in config plist kernel and kext patches
