RX 460 not working

Beitrag von „firefly_can_fly“ vom 3. Juni 2017, 21:46

On Inmac forum i found this:

Zitat

rx cards do work but you must bin patch the x4100 kext and put it in the macos folder and edit the info.plist in ether fakesmc or applealc kext. my rx480 worked via this method same for pavo

So i made my own fakesmc and after @stehor send me in dm on inmac ready to use fakesmc (basically you copy graphic card section from amd4100kext to fakesmc and that should make it work), but not for me.

So if anyone who have RX460 and OZ as boot loader can check this method - i will be happy to know the results.

I still have the problem, if someone already defeated the problem - share how you did it.

p.s. i didn't tried ssdt/dsdt because i don't know how exactly make proper ssdt, if someone would guide me - that would be fantastic.
