With 8.4MB BIOS replacement for 16.8MB BIOS

Beitrag von „al6042“ vom 3. Oktober 2017, 11:53

Are you talking about the capacity of the physical BIOS chip or the size of the BIOS-ROM-file?
What are the hardware details behind this question?

Since the ROM-filr itself need to have enough space within so called "partition" in the ROM-File, it doesn't really matter if the chip is double the size.

The ROM-File itself cannot be larger than the already given filesize.

That's why everybody talks about getting rid of some functions to be able to add a couple of new ones.
