Erledigt Hilfe bei Install: X299 | i7-7820X | GTX1080 -> Sierra 10.12.

Beitrag von „drnoodle" vom 23. Oktober 2017, 15:28

Welcome Dany,

if you install Clover, you also have a config.plist on your 2nd partition (EFI). You have to install the "clover configurator", with this app you can mount the EFI partition of your hard drive.

1) i haven't a config.plist is a problem? -> answered above
2) in clover what do i select in DRIVER64UEFI? -> check screenshot
3) did u use a partivular kekt to add in the EFI partition of the usb stick? -> ZIP (you have to delet the Nvidia Kext!)
4) for the AIO cooler (corsair h115i) how do I have to behave? is there something like Corsairlink for windows? -> dont know, i got a similar watercooler, but i dont use any additional apps.
5)Can you post me your clover setup? -> ZIP

If you installed OSX High Sierra with the stick, you have to copy the EFI folder to your hard drive afterwards. Otherwise it wont work.
