## CORE\_DXE compressed in UEFITool

Beitrag von „cehos“ vom 24. Oktober 2017, 19:31

Hello,

don't you know someone right way how to extract - compress - insert compressed CORE\_DXE via UEFITool. I think that is:

### UEFITool Export

I find **CORE\_DXE** in Bios region

I find **PE32 image section** of CORE\_DXE and **Extract Body**.

Select **All Files** and name it as File name **CORE\_DXE.efi** (Core dxe has 1,6 MB - it's same if I expotr it via MMTool)

**Compression:** I used Kext2Ffs and i placed CORE\_DXE.efi to EFI folder and run the script. Final compressed file CORE\_DXE.ffs has 238 KB.

### UEFITool Import

**PE32 image section** of CORE\_DXE and **Replace Body** with compressed file CORE\_DXE

If I save a Bios image I have no errors

Is it right way to compress CORE\_DXE via UEFITool?

Thank you

Cehos
