Hackintosh möglich / empfehlenswert für DELL XPS 15R SE 7520

Beitrag von „Harper Lewis“ vom 13. Dezember 2017, 19:55

Aber gerne doch. Wobei ich nicht weiß, was genau hier aus den [FAQ](#) auf die 7730M zutrifft und ob die GPU dennoch problematisch sein könnte:

Zitat

What properties should I additionally inject for my MOBILE GPU?

Mobile AMD GPUs have very few issues but only if they are physically connected to the display (i.e. AMD Switchable Graphics users are out of luck). You will almost certainly have to inject a VBIOS (ATY,bin_image property) that is exactly 64 KBs. Afterwards you will have working external displays. For internal display you most likely will have to inject its EDID (AAPL00,override-no-connect property) and set display channel representation to 6 bits (@0,display-link-component-bits and @0,display-pixel-component-bits properties). If you have a resolution higher than 1600x900 you will likely have to also set @0,display-dual-link to 1.

Further details are available in SSDT sample to get the general idea.

Wenn das gerät aber eh rumliegt, sollte man das doch unbedingt mal ausprobieren.
