## **Mac Pro 2009 upgrade**

**Beitrag von „igorjos“ vom 22. Dezember 2017, 00:21**

Been on a hackintosh since 2010 on clover and now on ozmosis.

I am not a noob or advanced user, something in a middle, so I always have a problems with hardware tuning in hackintosh.

I decided to sell some parts of hackintosh. It was GA-Z97X gaming 7 motherboard and I7-4770 processor. I left wifi/bluetooth card bcm94360cd with PCI-E adapter with antennas. Two 8gb crucial ballistix sport memory cards, so together 16 gb (they 1600MHz)

After researching, a week ago I bought Mac Pro 4.1 year 2009 from UK. It cost Me about 530 Euros with postage.

I was looking only for Mac pro 4.1 and 5.1 and only with two processor slots due to the capability of upgrade in the future.

Mac 4.1 on the fifth part is cheaper than 5.1, and Mac 4.1 can be firmware updated to 5.1 due to the same hardware inside it.

Specification are:

Mac Pro (Early 2009) 4.1

8-core: Two 2.66GHz Quad-Core Intel Xeon 5500 processors

Memory: 4gb

NVIDIA GeForce GT 120 with 512MB of GDDR3 memory

HDD: 500GB with El Capitan

Upgrade will be updated soon!
