[Gelöst] Ozmosis GA Z77P-D3 - Problems encountered

Beitrag von „visin“ vom 11. Januar 2018, 06:41

Hello everyone, but also to trouble you:

I am from China, my foreign language is very bad, and I am using Google Translate now. I hope you can understand.

My black apple is using ozmosis and Gigabyte z77p-d3, and the ozmosis version is @griven's "Z77PD3_Rev_1_1_HighSierra.F8e.zip" from "https://www.hackintosh-forum.de/index.php/Thread/ 18265-Mod-f% C3% BCr-das-Z77P-D3 / ", the current normal use, but there are several minor problems need to be resolved, I hope you can help me, thank you!

1, I hope when the boot does not appear Gigabyte's logo, if possible, can be replaced by Apple's logo.

2, there will be a section of the opening code, I do not understand what this means, how can we make this code does not appear? What do I need to do?

3, I only run this black apple macos operating system, so do not need to choose other boot process, can skip this step, start macos directly? Like a real Mac.

4, ozmosis bios from @ griven's, do not you need DSDT and defaults.plist? I did not find the matching DSDT and defaults.plist.
