Hallo,

Could you make a list of the functions that crash and the ones that work fine?
It may be acceptable to proxy more functions in AptioFix if necessary.
So far I had to use ResetSystem, and it worked fine for me, but others may indeed crash.

By the way, do you know whether Apple changed AppleEFIRuntime interface across different versions of macOS? I currently call functions directly via gPEEFIRuntimeServices, but it is safer to invoke AppleEFIRuntime. The only reason stopping me from reversing the header is that they may change it at any time.

P.S. Sorry, don't know German, hoping for Google Translate.
