1. That resource was adviced me by the one pupil from applelife.ru.

2. Problem.
Several times ago I used El Capitan and FCPX 10.3.4. All're ok and I hadn't any problems.
When I knew, that fcpx developers add color tools to fcpx 10.4, I want to test it, but fcpx 10.4 require macos 10.12.4. So I updated my OS to 10.12 ans install it. When I use that app, that I'm watching a complete failure of the system, when scroll any clip on timeline or playing it. watchong colour circle instead a mouse cursor only ("FCPX randomly freezes macOS, but mouse can still be moved."
" - https://hackintosher.com/guide...-issues-fcpx-high-sierra/). Interface is frozed. no access. In that time I can go into system over ssh only. view any file over bash. log files etc. But I can't find problem ant at that topic I had wander accidentally.
For All I don't burn with desire to use fcpx. I can use Davinci Resolve, there are the better color instruments, but I have Interest, why my system have problems with fcpx 10.4/sierra, and on 10.3.4/Capitan I hadn't problems. Maybe I will face this problem not only in fcpx (future) and I want be to ready for it.

3. I'm Reading that topic (Quicksync, Virtual-Screen Abstürze und iGPU+ded. GPU mit Grafikbeschleunigung). Thank you.
