macOS High Sierra HP 17-BS504NG 17,3

Beitrag von „xcarsx" vom 27. Februar 2018, 19:11

Ich habe das hier gefunden

Solutions:

1. QE/CI: Solved by enabling the minStolenSize patch alternative to the minStolenSize patch, uncommenting the #AddProperties located in the config.plist, and then first boot with an invalid ig-platform-id (i.e.. 0x12345678) and then boot again with the real ig-platform-id.

[Note: Instead of booting with an invalid ig-platform-id, IntelGraphicsDVMTFixup.kext can be used]

[Note 2: After 10.12.6, KabyLake is natively supported, so KernelAndKextPatches/FakeCPUID and FakeID/IntelGFX are to be disabled or removed, instead use of one the ig-platform-id with corresponding kext patches (at KextsToPatch) located here]

2. Touchpad: I'm working on it, currently using RehabMan's ioio for enabling certain features (e.g. Running `ohio Clicking 1` will enable touch to click, and if you're like me, you'll make an startup daemon out of this.)

[Note: This is a I2C trackpad, so normal procedure (ie. simply installing VoodooPS2Controller.kext) won't enable the trackpad prefpane, see here for more info.]

[Note 2: For some weird reason, trackpad.prefpane is detected my touchpad again! (This has been a funny day!)]

3. Battery: Installed ACPIBatteryManager.kext

4. Wireless: Need to replace (didn't found a suitable half-mini PCIe card because of weird size)

5. Sound: See here (also, this thread, specially this post for more info)

6. Ethernet: Installed RealtekRTL8100.kext

7. Backlight: Followed this guide. Be sure to set config.plist/Graphics/InjectEDID=true

nur verstehe ich davon nicht viel!
