Will Only Boot when I target thru the Bios

Beitrag von „ssprod“ vom 7. März 2018, 23:52

High Sierra on SSD equates to APFS in almost all cases.

To display an APFS macOS Partition in the Ozmosis GUI you need to enter EDK-Shell and add it.

The Ozmosis bios you are using has the APFS-efi integrated and thus the macOS partition gets recognized and is selectable.

I installed H.Sierra via GUID, not APFS. Is this why this bios is not allowing OSX to boot automatically? I can boot, but only thru bios-target-High Sierra. Thanks.
