Windows 10 Dualboot Legacy Bios

Beitrag von „Politic“ vom 12. März 2018, 14:00

In the GPT schema I installed MAC first. Through DiskUtility I created a second partition and formatted it as MAC.

The trick is that if you're going to install Windows, you will remove the partition created in Windows Installer, and then you will install Windows into it.

Do not format this partition !!!

If you split the MAC into a MBR disk, then install Windows.
