Lenovo Ideapad 500-15ISK i7 6500U 2,5GHz 12GB RAM Intel HD520 macOS High Sierra / Catalina BETA

Beitrag von „al6042“ vom 1. Mai 2018, 10:55

Hi and welcome to the forum... 😊

Kext-dev-mode and rootless are not used anymore since macOS Sierra... do not bother around with those... 😊

Try the attached EFI-folder which contains current kexts and config.plist-entries, together with a patched DSDT.

Based on Clover 4449, with an SMBIOS of MBP13,1, incl. the necessary Details for High Sierra...

BTW:

Forget the AMD graphics card... it won't work... you should deactivate it in your Bios...
