Sorry for late reply,
That motherboard been working unpredictably, so when i was messing wth cooling - pins been damaged and even after the repairs it was still working not okay. Because when i put graphics card in it - it freezes even before the boot (in bios) and as I not good into understanding Ozmosis and how in works under the hood - i went and bought new motherboard z97x-ud3h, currently trying to make it work with Xeon Cpu and clover. Maybe after would go for Ozmosis once again.
