Erledigt Ozmosis H77N-WIFI / HD4000 Installation

Beitrag von „ryba" vom 15. Juni 2018, 10:05

Hello, friends!

Thanks for your wonderful forum and all the information that I found here.

So far I've done the following successfully:

- Modified original H77N-WIFI Bios with Ozmosis (used pre-built version with IGP enabled to avoid issues with HD4000)
- Installed and updated Sierra to 10.12.6 (16G1408) easily, using Kext_Updater (special thanks for that!)

My current problem is SMBIOS - I can't use my fresh Apple ID with Apple Store, Apple Music, FaceTime or iMessage.

I have read all of the information under https://www.hackintosh-forum.d...=39-Nach-der-Installation
but I am still not sure, if I understand everything correctly.

My questions:

1) I have two network cards on the motherboard, plus a separate wifi-card. I can't make my default LAN-card show as en0. How can I do it? Do I really need to have it as en0?
2) I am not sure, if the Apple S/N I generate with Clover Configurator has to have a match, or is it OK, if the Apple Service Check says "We're sorry, the number is not valid, please try another number' ?
3) How do I know that SMBIOS information is correct and full? Some fields in SMBIOS are empty, and I am not sure, what has to be inserted?

If my system is Ivy Bridge (3. Gen with i7-3770), which System Definition could I use? iMac14,1? (I have a 27" Display, but my SMBIOS currently shows a 21,5" Version)

EDIT: My ultimate goal is to be able to use Apple Store & Apple Music. iMessage/FaceTime are less important to me, but would certainly make a nice addition to the package.

Any help would be highly appreciated 😀 and thank you once again for all your help and infos

on this site.
