# **Erledigt** Who can help me convert the default.plist (Clover to Ozmosis) ?

## Beitrag von „al6042" vom 30. Juni 2018, 14:47

Do you have a working Ozmosis-ROM for your Coffee Lake Board?
If so, all the DSDT Renames, Patches and Drop Tables will not be available within the defaults.plist.
Also the FakeID for IntelGFX and the Audio Inject won't work.
All the KextsToPatch-entries need the Kernext-Patcher within the ROM to be added into a KernextPatcher.plist...

Are you sure you want to fumble around with Ozmosis on your Board?
Clover is the better solution in my opinion.
