Xiaomi Mi Air 12.5" Kabylake Trackpad

Beitrag von „talebabatto“ vom 12. Juli 2018, 12:22

Good morning,

did anyone manage to get the trackpad working on High Sierra 10.13.5 for this laptop? I downloaded the ACPI folder provided in the Xiaomi Mi Air 12.5" HS official post, but the touchpad SYNA3510 is seen as mouse without scrolling and without 2 or 3 fingers gestures. I am using VoodooI2C 2.0.3 with patched DSDT with GP0 pin and Windows 10 patch from [Alexandred github repo](#). The kext works in interrupt mode not polling.

Thank you for the help.

P.S. is there a way to make the laptop work without the hotpatches but just the DSDT patched properly?
