Thank you for the answer,

if I put the DSDT from post n.72 in your EFI ACPI/patched the system restarts on boot with a verbose output saying something about LP sunrise controller from intel. If I use my patched DSDT with your EFI the system boots fine but the shortcuts for the backlight don't work plus there is something that prevents the system to go to sleep.

I'd really appreciate if you could give me a hand looking at my EFI and IOREG output.
