Startproblem - GA-Z77Mx-D3H- Ozmosis High Sierra

Beitrag von „al6042“ vom 22. Juli 2018, 09:26

It seems like some of the entries in the Defaults.plist of the newer ROM are different then the one in your original ROM.

Do you use the folders on your hidden EFI-Partition?

You can use manually edited Defaults.plist, newer Kexts and a patched DSDT.aml within this folder structure.

There should be folders like:

Zitat

/EFI/Oz = for the "Defaults.plist"

/EFI/Oz/Acpi/Load = for the patched "DSDT.aml"

/EFI/Oz/Darwin/Extensions/Common = for Hackintosh-Kexts
