[gelöst] Acer Spin 5: Finetuning !

Beitrag von „MrVanosh“ vom 10. August 2018, 13:00

Touchscreen is on USB, it's weird it not work OOTB. In ioreg macOS attach to it but it not work. It works for me OOTB in 10.12.0 and later on any updates it's not. My solution is UPDD Driver. You must write here <http://touch-base.com/contactform.asp?formtype=locate> Select USB connection write it's Raydium Touch System vendor id 0x2386 product id 0x3111 and they will send you driver to test. I confirm it works. If you will be polite and ask they will give u discount or even free license. They give me free license for diagnostics. It support gestures, on screen keyboard and it's all of we need for touchscreen and 10 point multi touch. I have newest version <https://drive.google.com/open?...K9H8C4bkvbwkwMxGyH-tvU6zZ> You can install it to test, but without license it have some limitations. Now I'm trying to make auto rotation work on macOS, maybe we will have full working hack 2in1 laptop 😄 But I will start to do it maybe tomorrow. Today at 21 I will have ride 1200km to my country.
