**Beitrag von „Politic“ vom 11. August 2018, 11:44**

**On the GIGABYTE GA-B150N motherboard Phoenix-WIFI I used Mojave to install:**

- drivers64UEFI - picture 1

- kext/Other - picture 2

Everything is packed in the Clover folder, where it is config.plist.

The Internet works right after installation, Graphics is on HD530 - 1920x1080

Sound: After installation, it does not work. I installed VoodooHDA-2.9.0-Clover-V12-master - picture 3.

Please note that installing Mojave in Customise before installing !!

After installing Voodoo, set Output + Sound Effects HDMI.

But there is no volume control on the top bar, so I installed the MonitorControl utility. Super controls both the sound and the contrast of the monitor. You must allow access to the installation after the PC is started.

Good luck 👍
