So, you only use VoodooHDA to get HDMI-Audio working?

Please reboot your machine and use the F4-Button several times, while in Clover Bootmenu.

This extracts the ACPI-Files out of the BIOS onto the EFI-Partition, but without optical or audio response.

Check the directory /EFI/CLOVER/ACPI/origin after you've booted.

In there should be a couple of .aml-Files and also the DSDT.aml.

Please Zip the /origin-Folder and post it as attachment.
