Ok, then please try the following files.

The patched DSDT.aml must go to /EFI/CLOVER/ACPI/patched.

The config.plist must replace your current one, since all the DSDT-Patches set up in the old one, are now in the DSDT.aml itself.

Please rename your old file to "config-org.plist" before you copy the new file.

Also delete or uninstall the VoodooHDA.kext and all the AddOns.

Please check for a HDADisabler.kext, which might be installed, and delete it also.

After deleting these kexts run the application [Kext Utility](#) to recreate the Kext Cache.
