After using [@mt-fr](#) EFI folder I still cant get the touchpad or Intel wfif to work ☹
I've been using a usb mouse ever since I installed Mac and a Edimax 2.4Ghz wifi usb dongle to connect to internet.
The sound I can get working by replacing the AppleALC.kext with VoodooHDA.kext in Clover folder. The sound quality is good but the maximum voulume is low compared to Windows. I've read that it is normal when using Voodoo kext instead of the Realtek ALC audio drivers.
VoodooI2C and VoodooI2CHID kexts don't seem to work and if I dont block I2C OSX cant boot.
I think my DSDTs might need the Windows patch for Voodoo. Is the ELAN touchpad unsupported or is there anyone who got it working that can help?
