## **intel UHD Grafics 620 Surface Book 2**

**Beitrag von „tikizondo94“ vom 25. August 2018, 14:52**

Ive got the same issue your facing with my UHD 620. No matter what, I cannot get QE/CI to run on my machine. Ive tried countless combinations and have had help from across different forums. Still have never figured it out. Machine installs OSX from 10.12 to 10.14 Flawlessly and runs "without" QE/CI fine. But anytime i inject intel with 0x59160000 or Set a device ID using the new WhateverGreen And lilu process, It locks at the same point. IOScreenLockState. So I feel your pain! lol.
