tell me where to throw Acpi Patcher, Kernel Patcher, Theme

AcpiPatcher and Kernextpatcher have to go into the ROM as ffs (Kernext is already in [here](#)). You can place a Theme as Theme.bin in EFI/Oz: [Neue Themes / Ozmosis GUI / BootMenü / UserInterface](#)

These are the latest drivers that I used: [macOS Mojave Ozmosis BETA – OZ167X-XMAX](#)

Can you tell me how to solve the problem?

Use Lilu and Whatevergreen,kext on your Oz System...
