Changing boot args in boot menu?

Beitrag von „poof“ vom 14. Januar 2019, 23:30

Hi all,

My first hackintosh used bootloaders that allowed me to change the bootargs at boot time.

This allowed me to add something like `nv_disable=1` temporary, so I could install the webdrivers and reboot without the argument after a restart.

Is there something like this in Ozmosis? Now I need to login to my windows boot, mount the efi partition, edit the defaults.plist, reboot and reset NVRAM, boot into macOS, mount the efi partition again, edit the defaults.plist again, reboot and reset NVRAM... I'm probably not the first to find this cumbersome.

Thanks,

Niels
