

# Kurzanleitung: High Sierra, Mojave ,Catalina, BigSur und Ventura auf ASUS Zenbook UX330UAK

Beitrag von „mouthbow“ vom 30. Januar 2019, 13:08

Hi Michael! Thanks for your hard work! I have exact the same laptop model like you and trying to use your EFI folder.

My problem: When I boot I'm not getting the option to install from USB, only boot my windows in many different ways...

What I have done:

- Diskutility to format the pendrive in Mac Os Extended ( journaled) using this guide

- <https://hackintoshher.com/guide...os-flash-drive-installer/>

- Mounted EFI partition using Clover Configurator

- Copied your EFI Folder to EFI partition

- Added (after a couple of not succesfull tries) UsbInjectAll.kext

I have read the guides I found and this post but I don't know if there is other step that I have missed and I don't know if I have to use something from your "Additional Things" folder.

I hope you can give me a tip to understand what is going on.

Many thanks in advance!
