

Radeon VII im Hackintosh

Beitrag von „DSM2“ vom 20. Februar 2019, 16:29

[Gigamaxx](#) Thank you for your help but it doesn't change anything... Black Screen.

It's not that I don't know what I'm doing and of course I fixed the permissions afterwards using Kext Wizard or other methods.

I do 99% of any Kext edits also with Xcode, also in this case during my attempts.

Apart from that I am not the only one where it doesn't work. kgp-imacpro shares exactly the same torment.

Seems like you're the only one where it works for whatever reason.

Edit: OK and now I know why... It only works this way if iGPU is enabled in the BIOS.

An X299 doesn't have any iGPU and of course no settings for this and that's why it doesn't work.

An user reported this on Tony in kgp-imacpro's X299 Thread.
