macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „witjojo“ vom 15. April 2019, 17:54

1. Why to disable the iGPU? I use the integrated HD 4600 in 10.14.3.
2. The installer does not start, so no Verbose mode.
3. If i start installer boot.efi from shell i get "busy timeaot (60s): AppleACPICPU". After a time (with AppleACPICPU) i get a Apple Logo and nothing happens.
4. I think the KernextPatcher is ok - see post [#284](#)
5. Kexts are all up to date
