macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „txl263“ vom 24. April 2019, 12:49

[Zitat von kuckkuck](#)

The latest ROMs from the download section include updated defaults.plist. If you have issues with your EFI "Defaults.plist", please rename or delete it so that the integrated Defaults from the ROM will be used. (No NVRam commands needed; NVRam reset after renaming the EFI-Defaults)

Also make sure that you are not trying to install 10.14.4+ with that ROM and that your iGPU is disabled. Make sure the ROM was flashed correctly and/or flash it another time if needed (rename it to the original ROM-file Name and reset the BIOS to defaults).

Thank you for your response!

Like I said, my "Defaults.plist" has some issues, so I use the ROM directly that you provided(Did not modify anything).

~~And ROM was flashed correctly Checked!~~

~~iGPU is disabled Checked!~~

~~Install macOS Mojave 14.0.22 = 10.14.0 Checked!~~

rename it to the original ROM-file Name and reset the BIOS to defaults **Did not checked!**

Now, I will rename it and flash again.

SO is this the reason that can not into bios setup screen?I always feel that it is not quite right, maybe.

Anyway, I will flash the ROM now, and feedback after a while.

vor Freude johlen

It worked!!!!

Install 10.14 now! Hope everything is OK!

Thank you very very much!

=====

Bad news, The screen blurred.

My card NVIDIA GeForce GTX 660 was perfect at before. Is there any solutions? Upgrade system or driver?

If there is no solutions I want back to 10.12.
