

# OpenCore Sammelthread (Hilfe und Diskussion)

Beitrag von „locus“ vom 13. Juli 2019, 17:10

Hi!

Sorry, my German is not good enough so I will ask in English,

I have OpenCore 0.04 working really good. And this will sound like nagging but after the first part of the macOS progress bar and the second part of the progress bar when it is going to graphical I have a rather long period of no visual feedback, I guess around 10 seconds, just a black screen.

It is not a big deal but if this slowdown could be decreased that would be great!

Is this something others see too or is a 'setting' I have to adjust? Anyone see this too?

macOS 10.15 beta 3 on a Gigabyte Z97N-WIFI, Intel i7 Haswell, Radeon RX560, 16 GB.

Nothing to special I think and a rather easy system for a hack.

I can't say if macOS Mojave did this too because I started using OpenCore with macOS 10.15 beta.

Anyone has any ideas? Thanks!
