Lilu/WhateverGreen and Ozmosis - Graphics in Mojave

Beitrag von „colourofsound“ vom 9. August 2019, 11:04

Hardware is:

GA-Z77X-UD5H

i7 3770K IvyBridge

Gainward GTX650Ti

16GB RAM

SanDisk 250GB SSD Boot disk

I also have a working 128GB SSD with Sierra on with the same system; so I can flip between the installs.

Internal graphics are enabled yes; I did read that was important. I think the issue is what the equivalent is to Clover's config.plist (I guess its Defaults.plist?) and what is the correct thing to put in there.

Placing the kexts is easy; its configuring them thats the hard part.

Thanks again for your help
