Coffee Lake Sammelthread (lauffähige Konfigurationen) Desktop

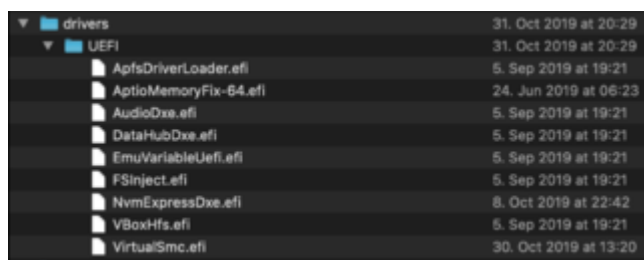

Beitrag von „al6042“ vom 7. November 2019, 19:22

Hi,

the missing changes in the Clover-based EFI came due to the fact that I swapped from Clover to OpenCore as my new bootloader last sunday.

The Clover-based EFI still used my Vega56 which I swapped almost 24 h ago to the Sapphire Nitro+ 5700 XT.

The latest EFI-package in post #39 contain the following EFI-drivers:

As you can see only the AptioMemoryFix-64.efi is older then the other ones., since it was added manually.

You'll find my OC-EFIs in [OpenCore Sammelthread \(lauffähige Konfigurationen\) Desktop](#)

I just added the EFI for the 5700 XT.

Please make sure, that you'll change the config.plist values in "PlatformInfo"->"Generic" before you use the EFI-package.

Also make sure to verify the values and keys in "Device Properties"->"Add", since you'll find my Broadcom Wifi/BT-combo entry giving you a hard time to boot... 😊
