As you can see in my Profile, i use a Vega 64. It would be nice if you could add it to the kext. Provided it isn't too much work for you. I havn't downloaded the kext yet, will do it right now and have a look into it. Perhaps i'm able to check out of my own what your'e doing. Thx.

DANK!

I can see Vega cards are supported by the RadeonMonitor.kext already

Good news with 10.15.2 b1 : wake from sleep problem gone with navi cards !
