Vorke V8 Mini PC (i7-8750H): IGPU will nicht

Beitrag von „thexsenator“ vom 25. November 2019, 19:41

I think it depends on the adapter and your luck which adapter you have 😊 on the other forum there was a guy who tried to use an original apple adapter which certainly worked flawlessly with his mbp, but he got black screen with the vorke v8. He bought another one (didn't mention the brand and model). The Type-C connector is the same on this mini pc. I have two type-c hubs.

This one works under osx and windows and linux:

[Nica 4 port usb hub](#)

This one is total dead, not working at all, however works flawlessly on my hp omen gaming laptop.

[UGREEN 4 port usb hub](#)

There is something I forgot to mention to my tests, there is a limitation with the displays with macmini8,1 smbios.

I have two displays, one LG Ultrawide 34UC74G and an Asus MX299Q. As macmini8,1 i can only get 144hz refresh rate with single display connected only 100hz, with imac14,2 the thing can drive the LG at 144hz and the Asus at 60hz. I verified the refresh rates with ufo test.
