

[SUCCESS] Gigabyte Z390 M Gaming + RX 580 Nitro+ [EFI im Anhang]

Beitrag von „hsathler“ vom 24. Dezember 2019, 03:09

Hello guys! Does anyone knows how to configure SATA Hot Swap to work? I configured it in BIOS, but the system can't recognize when I plug in the external HDD.

[UPDATE]

Hello again guys! So answering my own question, I found a little trick to enable Hot Swap, so if anyone else is interested:

Open config.plist in Clover Configurator and in the Kernel and Kext Patches / KextsToPatch include the following info:

Name: AppleAHCIPort

Find* [HEX]: 40600200

Replace* [HEX]: 00000000

Comment: SATA Hot Swap Fix

Make sure it's enabled, save the config.plist and restart.
