Install Catalina on Lenovo Ideapad s145 i7-1065G7

Beitrag von „al6042" vom 16. April 2020, 18:43

Hi [TUNIN96](#) and welcome to the forum... 🙂

This old MacbookPro8,1 SMBIOS cannot be used with Catalina, since the model's latest macOS is High Sierra.

That's the info in your picture.

Since the 10th gen CPUs are currently not support from macOS this might get a little tricky.

Please try the attached EFI, which contains the SMBIOS of the current MacbookPro16,1, but with a faked internal Graphics setup in hopes that it might help to get a working picture in Catalina at all.

Also be aware, that your Laptop does not have a builtin network card and the Wifi/Bluetooth thingie might not be supported.
