

CFG Lock

Beitrag von „vit9696“ vom 6. Juni 2020, 17:10

I would say we will need to rename `VerifyMsrE2` to something like `MsrE2Ctl` and make it accept arguments like `-check` (and do what `VerifyMsrE2` currently does) and `-unlock/-lock` (and perform your tool logic). Without the arguments it can possibly have some interactive mode.

A good start will be a PR of this change to `OpenCorePkg`. Then we could review and bring the changes to the project codestyle and such. For the arguments you can use `GetArguments` function from `Library/OcMiscLib.h`.

Thanks a lot!
