I am very grateful, once again I apologize for the last translation. Now I will translate into English, I hope there will be fewer mistakes with it. I tried including dsdt in the bootloader to check. But unfortunately the computer still restarts if I tell it to shut down. And after it boots to the desktop, it gives an error that it was not turned off correctly. But if you close the error window, the system works well. Can you tell me what the mistake is? If necessary, I can send logs from the debug version of OpenCore.
