Can you please tell me, maybe my board has a problem with uninstalled USB ports? I created dsdt.aml for my board in MaciASL, applied the "Gigabyte Shutdown Fix" patch in it and tried to start the system with it. It started, but some of the USB ports stopped working, only USB 2.0 remained operational, and the problem of rebooting instead of shutting down was still the same. Before that, part of the USB ports did not work for me (4 pieces of USB 3.0) And I could not get them with patches and different kexts. By the way, when I loaded OpenCore along with the created dsdt.aml, these kexts for USB were active.
