

macOS 11 BigSur Dev-Beta Clover Patch

Beitrag von „kuckkuck“ vom 7. August 2020, 16:32

This looks like either an OCQuirks configuration issue or ACPI problem. Check early boot process to make sure that no ACPI Errors show up. I'd need a little more information about your current configuration in order to pinpoint OCQuirks issues.

Have you had a shot with most recent Clover master? Kext Injection should work at least when forcing prelinked kernel now, so no more Kernel UserPatches necessary (You might consider adding automatic NVRam Injection for the necessary values to force prelinked for now as I have done in my Clover Mod). Can't tell about KC implementation though, haven't had the time to take a look at it yet. 5121 should be able to detect the KC Header in order to execute patches but I don't know if these actually succeed or if there are incompatibility issues with Clover or even the KextInjection mechanism itself when using KernelCollections.
