The sleep Issues with VoodooPS2 are well known and obviously by now there ist no solution for that (-> <https://github.com/acidanthera/bugtracker/issues/816>) you may try other branches of VoodooPS2 which may work across sleep but won't offer any multitouch Gestures. The Trackpad also does work (kind of) after sleep just try to use three Fingers instead of one and you'll see that it is not completely dead it simply does not recognise the Gestures correctly (maybe a VoodooInput issue I don't know)...

Hm got it. Now I'm trying opencore with mojave. On the setup screen, the touchpad was not working but the touch screen was working. so I continued with the installation. After the installation is finished, I will try to solve the kexts by trying. I will continue to write here because it was so helpful. Which efi do you use in your yoga right now? Do you have the possibility to send? Sorry for my English
